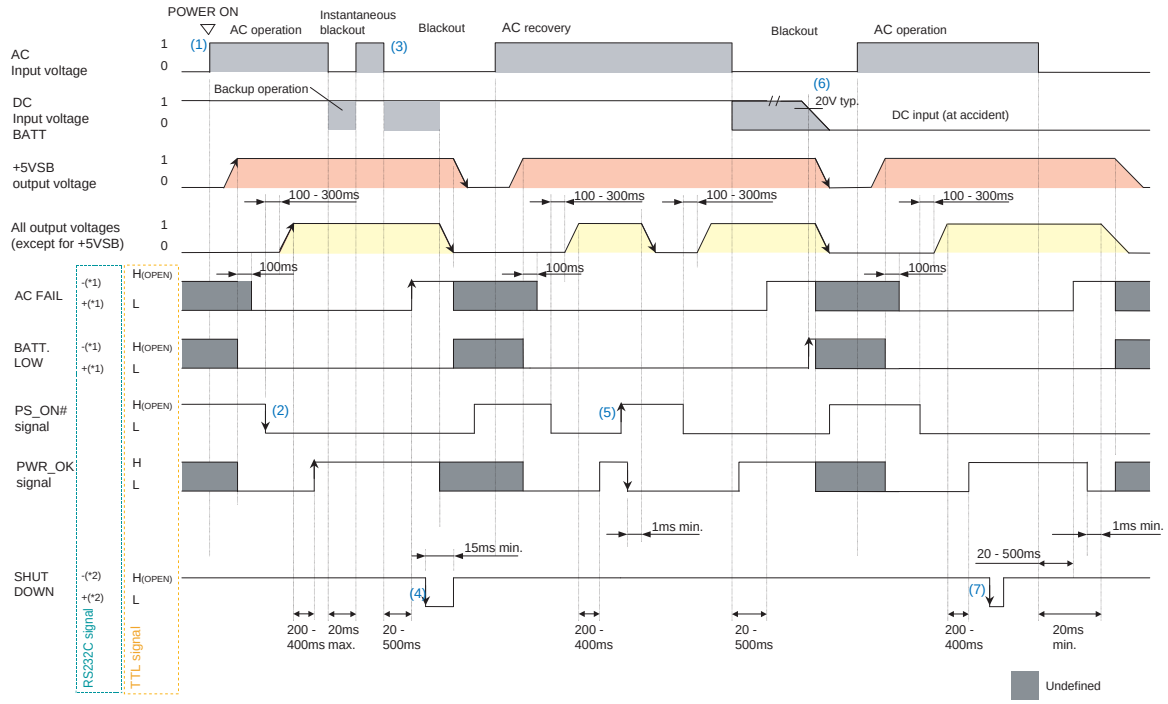
Sequence Diagram

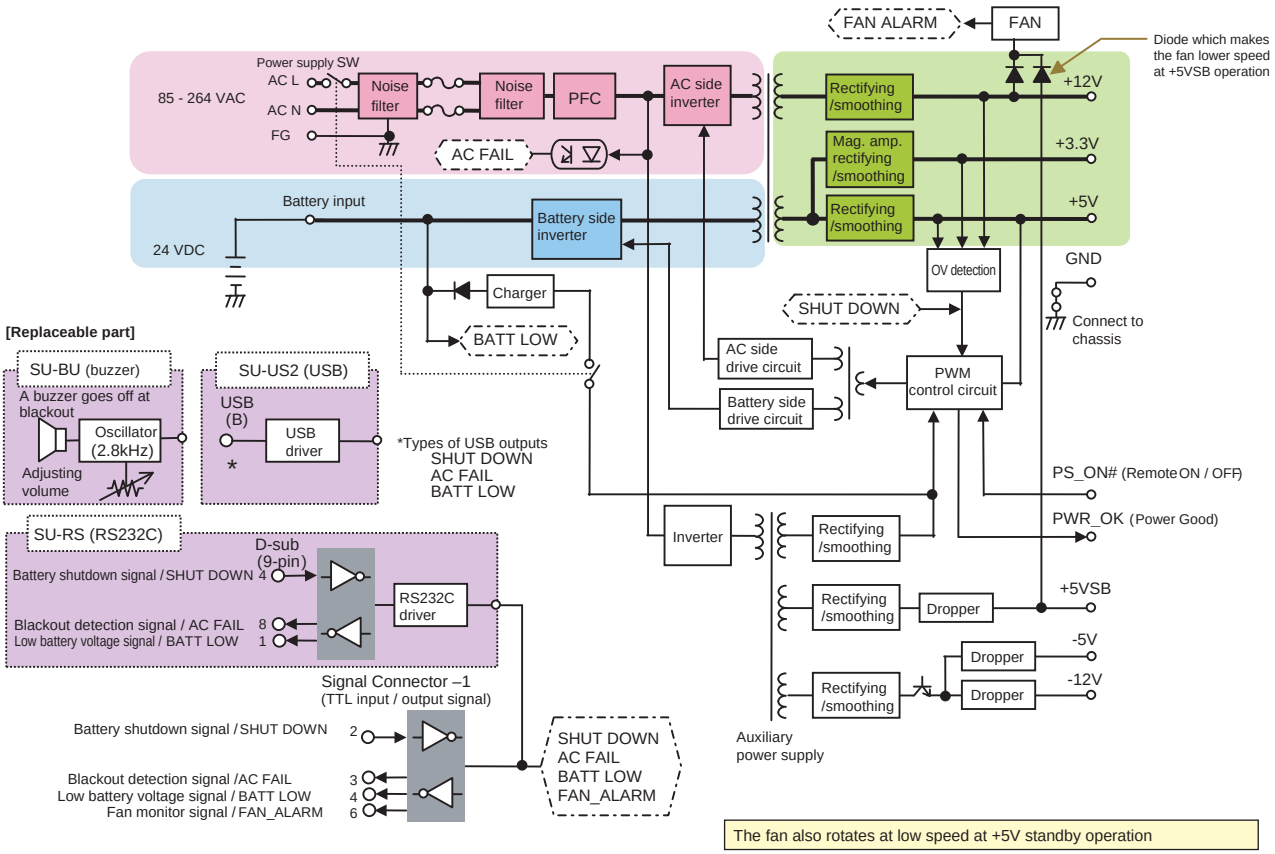


(*1)
Negative signal output is -9V typ.
Positive signal output is +9V typ.

(*2)
Negative signal input should be +0.4V to -20V.
Positive signal output should be +2.8V to +20V.

(1) With AC input, only +5VSB starts up.
(2) With PS_ON# 'L' input, all outputs start up. After 200 - 400ms, PWR_OK goes 'H'.
(3) AC FAIL 'negative (RS232C)' or '(OPEN) (TTL)' is delivered 20 - 500ms after blackout.
(4) At blackout, all outputs including +5VSB shut down with SHUT DOWN 'positive (RS232C)' or 'L(TTL)' input of 15ms min.
(5) When AC input and all outputs including +5VSB start up, all outputs except for +5VSB shutdown with PS_ON# 'OPEN' input.
(6) When the battery voltage decreases to 20V typ. at backup operation, BATT LOW 'negative (RS232C)' or '(OPEN)(TTL)' is delivered; after it decreases to 19V typ., all outputs, including +5VSB shutdown.
(7) At AC input, the output does not change even SHUT DOWN 'positive (RS232C)' or 'L (TTL)' input.

Block Diagram



The fan also rotates at low speed at +5V standby operation

In many cases, 1.5A max. load is drawn from +5VSB even at standby operation.
In order to prevent shortening the power supply's life span caused by heat, the fan rotates at low speed to cool down the temperature inside the power supply.
